Overview

- 1 Introduction
 - Motivation
 - Applications
- 2 NMR Assignment Background
 - Nuclear Magnetic Resonance Spectroscopy
 - Data Collection and Manual Assignment
- 3 Automation Algorithm
 - Preprocessing
 - Assignment
 - Goal State
- 4 Conclusion
 - Results
 - Outlook

Motivation

- Nuclear Magnetic Resonance Spectroscopy
 - Gain knowledge about protein structure
 - Study how mutations lead to diseases
- Problems
 - Generates large amounts of data
 - Data analysis is slow and error prone
- Goal
 - Automate the assignment process
 - Decrease human error
 - Increase productivity

Applications

- Studying Mutations
 - Protein folding
 - Biological effects
- Pharmaceuticals
 - Block proteins leading to mutations
 - Prevent onset of disease

Mutation Example

Nuclear Magnetic Resonance (NMR)

- NMR: phenomenon in which atomic nuclei absorb and re-emit EM radiation
- ① Alignment of nuclear magnetic spins in constant magnetic field
- ② EM radiation pulses disturb alignment
- Chemical Shift Values Generated
 - Resonant frequency depends on environment
 - Deviation from the Larmor Frequency creates chemical shift values

Assigned Chemical Shift Values

NMR Experiments

- HNCACB experiment
 - Generates C_α and C_β residue i and $i - 1$
- CBCA(CO) NH experiment
 - Generates C_α and C_β for residue i
 - Confirms residue data

Backbone Structure

HNCACB

Manual Methods

- Most time consuming part
- Missing and ambiguous data forces chunks to be skipped
- Prone to human error

Timeline

Protein
Production
at least 5 days

Data Assignment
20 days to 9 months

NMR
Experiments
1-2 days

Automating Assignment

- 1 Initialization
- 2 Generating child nodes
- 3 Goal State
- 4 Solution State

Initialization

- Expected amino acid sequence
 - Converted to expected chemical shift values
 - Stored as the reference protein chain
- NMR experiment's chemical shift data
 - C_α and C_β for residue i and $i - 1$
 - Stored in a tile
- Missing data
 - Place holder tile generation
- Grouping

Grouping

[2]

Starting the assignment

Tiles to assign:

Group 1

Group 2

Reference Protein Chain		Nodes
Chemical Shift	Group	
13.5	1	
9.5	2	
11.4	1	
8.8	2	

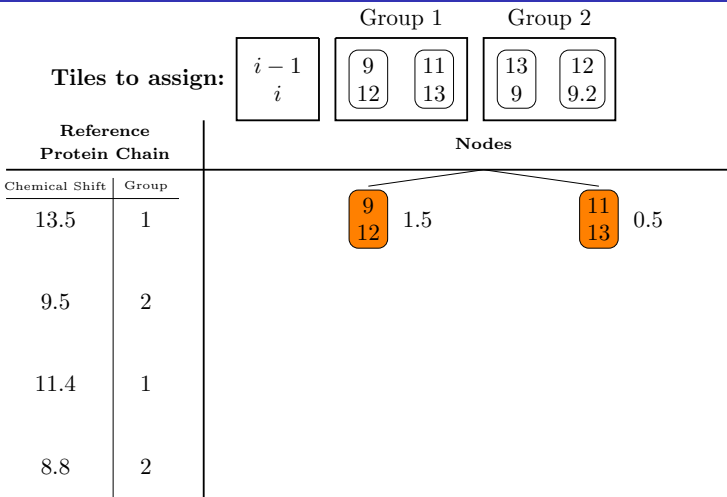

Starting the assignment

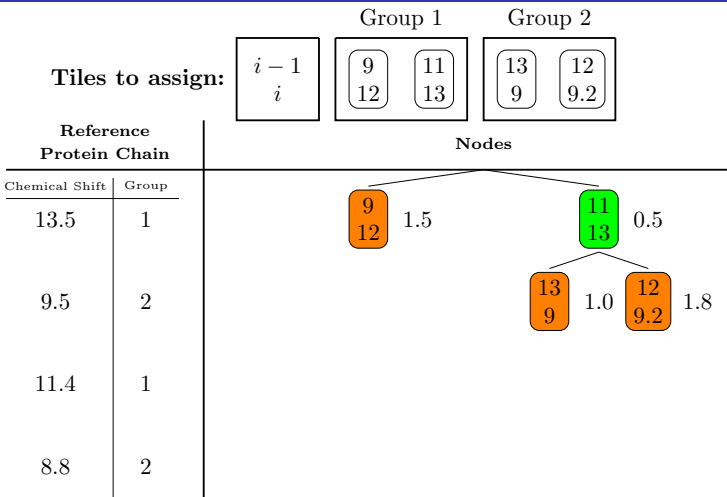

Cost Calculation

- Accuracy matching the protein chain residue
- Accuracy matching the tile above current tile
- Cost of placing all previous tiles

Generating child nodes

Generating child nodes

Generating child nodes

Generating child nodes

Goal State

Goal State

Tiles to assign:

$$\begin{matrix} i-1 \\ i \end{matrix}$$

Group 1

Group 2

9

11

13

9.2

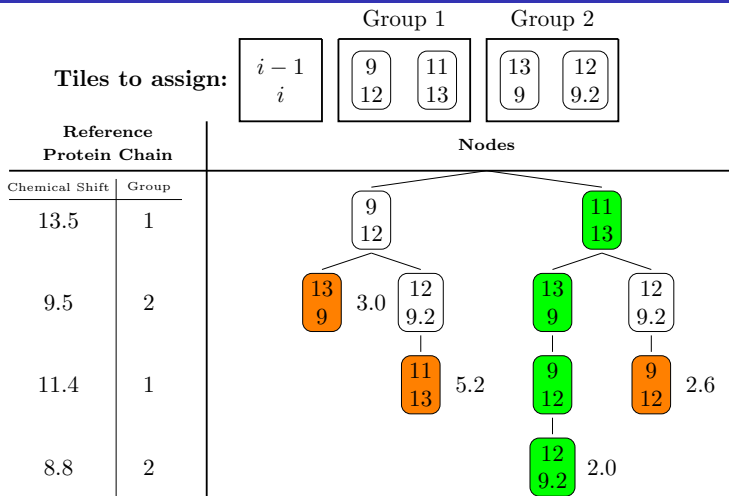

Reference
Protein Chain

Nodes

Chemical Shift	Group
13.5	1
9.5	2
11.4	1
8.8	2

Compared to Naive Approach

14.1% of the possible combinations

Time of Assignment

Child Nodes Generated

Future Goals

- Parallelization
 - Decrease assignment time
 - Allow for larger data sets
- Machine learning
 - Optimize cost calculation
 - Increase accuracy of assignment
 - Decrease assignment time
- Custom data structure
 - Limit storing repetitive data
 - Faster node selection and generation

Acknowledgments

- Dr. Tim Urness (Mathematics and Computer Science)
